2) Data Science can analyze historical patient records to Identify health patterns. It can help predict diseases and patient risks.

4) Data Science can analyze transaction patterns and customer behavior. It can Identify unusual transactions that differ from normal activity.

6) Data science can analyze students marks attendance and learning activities It can Identify students who are struggling academically.

8) A Data Science can analyze traffic data from roads, cameras and GPS device It can Identify congestion patterns and busy routes. Traffic flow can be predicted using historical and real-time data

10) This shows the variety characteristic of Big Data Variety means data exists in different formats and sources. Excel tables are structured data while reviews may be unstructured or semi-structured.

12) A university stores student details in rows and columns. It is usually stored in databases or spreadsheets. student names, IDs, marks, and attendance are examples of structured Data.

14) The Big Data characteristic is volume. volume refers to the huge amount of data generated and collected. mobile applications can generate millions of user activity records every day.

16) The important characteristic is value. value means obtaining useful information and benefits from collected data. Customer data can be analyzed to understand buying behavior and preferences.

18) Apache Spark can be used for processing large datasets. using parallel computation Spark divides tasks across multiple machines. Process data efficiently.

20) Data visualization tools such as Tableau or Power BI can be used. They convert large datasets into charts, graphs and dashboards.

This helps organizations make faster and better decisions.
